

BÀI TẬP CHƯƠNG 2

Exercise 2: Write a program that uses input to prompt a user for their name and then welcomes them.

Enter your name: Chuck

Hello Chuck

***Lưu đồ giải thuật:**

The screenshot shows a code editor with a file explorer on the left, a code editor in the center, and a terminal at the bottom. The code editor displays the following Python code:

```
1 name=input("enter your name: ")
2 print("hello", name)
3
4
```

The terminal shows the execution of the program:

```
PS D:\Kĩ thuật lập trình> & c:/Users/ACER/AppData/Local/Programs/Python/Python313/python.exe "d:/Kĩ thuật lập trình/chương2 câu 2 .py"
enter your name: Nguyễn Trần Trường Trung
hello Nguyễn Trần Trường Trung
PS D:\Kĩ thuật lập trình>
```

The right sidebar shows the "Welcome to Copilot" message.

Exercise 3: Write a program to prompt the user for hours and rate per hour to compute gross pay.

Enter Hours: 35

Enter Rate: 2.75

Pay: 96.25

We won't worry about making sure our pay has exactly two digits after the decimal place for now. If you want, you can play with the built-in Python round function to properly round the resulting pay to two decimal places.

*** Lưu đồ giản thuật:**

The screenshot shows a Python IDE with the following code in the editor:

```
1 hours=float(input("enter hours: "))
2 rate=float(input("enter rate: "))
3 pay=hours*rate
4 print("pay", pay)
5
```

The terminal output shows the program's execution:

```
PS D:\Kĩ thuật lập trình> python.exe "d:/Kĩ thuật lập trình/chương2 câu 3.py"
enter hours: 30
enter rate: 10
pay 300.0
PS D:\Kĩ thuật lập trình>
```

The IDE interface includes a file explorer on the left, a chat window on the right, and a status bar at the bottom.

Exercise 4: Assume that we execute the following assignment statements:

`width = 17`

`height = 12.0`

For each of the following expressions, write the value of the expression and the type (of the value of the expression).

1. `width//2`

2. `width/2.0`

3. `height/3`

4. `1 + 2 * 5`

Use the Python interpreter to check your answers.

* Lưu đồ giản thuật

```
1 width=17
2 height=12.0
3 print("width//2=", width//2, ",type:", type(width//2))
4 print("width/2=", width/2, ",type:", type(width/2))
5 print("height/3=", height/3, ",type:", type(height/3))
6 print("1+2*5=", 1+2*5, ",type:", type(1+2*5))
7
```

```
PS D:\Kĩ thuật lập trình> & C:/Users/ACER/AppData/Local/Programs/Python/Python313/python.exe "d:/Kĩ thuật lập trình/chương3 câu 4.py"
width//2= 8 ,type: <class 'int'>
width/2= 8.5 ,type: <class 'float'>
height/3= 4.0 ,type: <class 'float'>
1+2*5= 11 ,type: <class 'int'>
PS D:\Kĩ thuật lập trình>
```

Exercise 5: Write a program which prompts the user for a Celsius temperature, convert the temperature to Fahrenheit, and print out the converted temperature.

*** lưu đồ giả thuật:**

The screenshot shows a Visual Studio Code editor window with a Python file named `chương2_câu5.py`. The code is as follows:

```
1 celsius=float(input("enter celsius temperature: "))
2 fahrenheit=(celsius*9/5) + 32
3 print("temperature in fahrenheit:", fahrenheit)
4
```

The terminal at the bottom shows the execution of the program:

```
PS D:\Ki thuật lập trình> & C:/Users/ACER/AppData/Local/Programs/Python/Python313/python.exe "d:/Ki thuật lập trình/chương2_câu5.py"
enter celsius temperature: 10
temperature in fahrenheit: 50.0
PS D:\Ki thuật lập trình>
```

The interface also includes a sidebar with file explorer, a chat window for Copilot, and a status bar at the bottom showing the current file position (Ln 2, Col 23) and encoding (UTF-8).
